L2: Entry 1 of 1

File: PGPB

Mar 31, 2005

DOCUMENT-IDENTIFIER: US 20050069109 A1  
TITLE: Incomplete call notification

Abstract Paragraph:

A method and apparatus for providing a telephone subscriber with data of uncompleted calls. A determination unit detects an uncompleted call by receiving a signal from a telephone switch or by monitoring the operation of the network exchange switch. The switch is then interrogated to provide the call details. The data is stored in a format for forwarding to the called party.

Summary of Invention Paragraph:

[0009] According to one aspect of the present invention there is provided incomplete call notification apparatus comprising:

Summary of Invention Paragraph:

[0010] a determination unit for detecting an uncompleted call by at least one of receiving a signal from a telephone switch and monitoring operation of said switch,

Summary of Invention Paragraph:

[0011] an interrogation unit for obtaining, from the switch, call data of the uncompleted call, the call being to a given called party, and

Summary of Invention Paragraph:

[0013] According to a second aspect of the present invention there is provided incomplete call notification apparatus comprising:

Summary of Invention Paragraph:

[0022] an aggregation unit, associated with the database and comprising:

Summary of Invention Paragraph:

[0024] an aggregator, associated with the comparator, for arranging the current call identification information together with any already stored caller identification information identified by the comparator as a single item, and

Detail Description Paragraph:

[0059] Referring now to the drawings, FIG. 1 illustrates an embodiment of an incomplete call notification apparatus according to the present invention. A telephone 10 is connected to a telephone exchange switch 12 in the normal way. For example, the telephone 10 may be a standard wireline telephone connected to the Public Switched Telephone Network (PSTN) and the switch 12 may be any switch forming part of the PSTN.

Detail Description Paragraph:

[0069] Data of the incomplete call as received by the database logic 18 using the protocol 32, is then written into the database 16 via a forwarding unit. The described embodiment, the forwarding unit is database read-write interface 34. A preferred feature of the present embodiments is an aggregation unit 36 which is designed to ensure that multiple calls from the same source are stored as a single
